

## Embedded Vision

It does not matter, whether space limitations like in mobile devices are present or not or special tasks require innovative image processing solutions with local intelligence. **Embedded Vision solutions** enjoy a steadily growing popularity. Especially performance improvements of single-board computers like Raspberry Pi, BeagleBoard, ODROID, etc. additionally boost this trend and make it possible to implement a variety of inspection and identification applications.

**Embedded Vision** systems offer a lot of advantages. They are

- small,
- cost-effective, and
- efficient.

For this reason, they are an effective image processing alternative besides the classic PC-based image processing systems and intelligent cameras.

We offer Embedded Vision products for the following interfaces:

- [PCI Express](#)
- [USB3 Vision](#)
- [USB 2.0](#)
