

## **Only greyscale images available with SVHS signal**

mvDELTA, mvSIGMA-SLC, mvSIGMA-SLG, pcIMAGE-SC, mvAcquireControl

The Conditions to capture color images from an SVHS signal are:

Input channel must be set to 2 if using mvSIGMA-SLC or mvSIGMA-SLG, it must be 4 with mvDELTA.

The used camera definition must be "SVHS" or a derived definition.

In the mvAcquireControl the setting "Greyscale" in the tab "Acquire" must be disabled.

Further the currently used monitor setting should support more than 256 colors.
