

Keyboard locks up when using MV test programs

mvCAM3

The SVGA library configuration, as supplied on the mvCAM with SuSE 7.2, is incorrect. The file "/etc/vga/libvga.config" should be edited and the following line located:

mouse Microsoft

This entry is in almost all cases incorrect and the mouse is not needed anyway. Please edit the line to read:

mouse none

.... and then save the file.

This should cure the keyboard lockup.
